Abstract

The invention relates to a device for separating module bridges arranged in a module bridge strip and for positioning the separated module bridges on a support element, comprising a dividing device for dividing the module bridge strip in the edge regions thereof between in each case two module bridges, and a placement wheel for separately receiving the separated module bridges on its peripheral edge side, for transporting the same at interposer edges in a slip-free manner, and for depositing the module bridges onto the moving support element after a rotational movement of the placement wheel has been carried out about an axis oriented parallel to the module bridge plane, once an accelerated movement has been performed and synchronism has been achieved between the module bridges and the support element in order to prevent slip movements.
